

Deductive Reasoning and Rotation of the Trunk

Linda-Joy Lee

This workshop will build on the principles presented in the talk “The Essential Role of the Thorax in Restoring Optimal Function”. The specific ‘ring assessment’ for loss of segmental rotational control will be demonstrated for trunk rotation. This will be followed with a clinical reasoning application for how to apply this assessment tool to tasks specific to patient functional goals and a summary of the key clinical findings that indicate when the thorax is driving dysfunction in other areas of the body.
